

SAR Arm with TLS1 Positioning System

Error-proof assembly in a clear workspace

A [suspended arm](#) is ideal for assembly stations where space is limited. It can be easily installed on most workplaces to help the operator handle the screwdriver in total safety and stability.

The [TLS1 System](#) makes each operation truly error-proof: it tracks the X-Y-Z coordinates to make sure that each screw is tightened only when the screwdriver is in correct position.

After many requests, we are pleased to announce that our Suspended Torque Arm model SAR XYZ will soon be available with TLS1 Positioning System, too.

Choose the proper tool holder for your screwdriver.

A tool holder is supplied separately, depending on the screwdriver you're using.

Tool holder for PLUTO
